Summary

Software Engineer with 2+ years owning frontend architecture for production React, React Native and TypeScript apps, including a 25+ component design system. Recently shipped Smart Bookmarks, a full-stack Next.js, PostgreSQL and Claude API app. Also builds Python APIs, AI agents and C++ software. Founder of Inscribe (4,000+ installs). Top 3 graduate (CGPA 3.81).

Technical Skills

Languages: TypeScript, JavaScript (ES6+), Python, C++, C#, SQL, PHP
Frontend: React, Next.js (App Router), React Native, TanStack Query, Material-UI, Tailwind CSS, SCSS
Backend & Data: Node.js, Django, REST APIs, PostgreSQL (full-text search), Drizzle ORM, OAuth/JWT
AI & Systems: Claude API (structured outputs), AI agents in Python, MCP, C++ UI rendering, geometry
Testing & Quality: Vitest, Jest, Playwright, React Testing Library, web security (SSRF), accessibility (WCAG)
Tooling: Git/GitHub, Vercel, Vite, Webpack, pnpm, Linux, Agile/Scrum

Experience

Software Developer *Mar 2026 – Sept 2026*
Ozbul Software *Famagusta, Cyprus*
- Owned frontend architecture for 2 production web apps (React, TypeScript) and 2 production mobile apps (React Native), working with designers and backend developers in two-week Agile sprints and code review.
- Built and maintained a shared library of 25+ reusable, accessible UI components (Material-UI, Tailwind CSS) that other developers built on, removing duplicated styling across the product.
- Wrote Jest unit tests that increased test coverage by 30%, alongside component tests with React Testing Library for the shared library and core user flows.
- Built the apps' server-state layer on TanStack Query for caching and syncing with backend APIs, and sped the apps up with lazy loading, memoization and code splitting while improving WCAG accessibility.

Software Developer Intern *Jun 2025 – Sep 2025*
Technolink Software *Remote*
- Built and maintained 10+ JWT-secured REST API endpoints in Python and PHP powering an AI-driven automation system used across 2 internal products.
- Configured AI agent workflows on Model Context Protocol (MCP) servers to route AI support requests.
- Diagnosed and resolved 10+ production issues in a live automation pipeline, tracing each to its root cause.

Software Developer Intern *Jun 2025 – Aug 2025*
Ozbul Software *Remote*
- Built a stock management web application with a small team using React, TypeScript and C#, working across the frontend and its integration with the C# backend.
- Built 20+ reusable, responsive, mobile-first React and TypeScript components and led a refactor of a legacy monolithic frontend into 10+ modular components, which led directly to a full-time offer.

Frontend Developer *Jun 2023 – Dec 2023*
Mensa Philosophical Circle *Remote*
- Shipped 10+ interactive, accessible web features with React and browser APIs, iterating weekly on member feedback.

Projects

Smart Bookmarks | *Sole developer; Next.js, TypeScript, PostgreSQL, Claude API, Playwright* *Oct 2026*
- Built and shipped a full-stack web app where Claude reads each saved link and writes a summary and tags; saves return instantly while analysis runs in the background, and every query is scoped to the signed-in user (GitHub OAuth).
- Secured server-side fetching of user-submitted URLs against SSRF by rejecting non-public IP addresses on every redirect, with timeout, 2 MB size and HTML-only limits; treated AI output as untrusted, validating structured JSON with Zod.
- Built accent-insensitive search in any language with PostgreSQL full-text search and a trigram index for Chinese and Japanese, covered by 35+ Vitest and Playwright tests against a real database.

Inscribe | *Founder & sole developer; React, TypeScript, Node.js, Vitest* *2022 – Present*
- Built and run a productivity browser extension with 4,000+ installs, maintained solo for 3+ years, shipping tagging, search, export (PDF, PNG, Markdown) and English/Turkish localization.

Omniplexus | *Modular robotics framework; C++, Gorgon engine* *2026*
- Owned the self-generating UI layer that builds each device's control panel from its data at runtime, so new hardware needs no new UI code; fixed crashes and linker errors in the undocumented engine by tracing its source.

Parametric Gear Library | *C++, computational geometry* *2026*
- Native C++ library generating 3D gear models from 5 parameters, with involute geometry written from first principles.

Education

European University of Lefke, Northern Cyprus *Jun 2026*
B.Sc. Software Engineering; CGPA 3.81/4.00; ranked Top 3 in department, Top 4 in faculty

Achievements

Teknofest Top 1% (AI in Aviation 2026, Robotics 2025), Top 0.5% (Tourism 2025) • Winner, Codespace x Couchbase (2023) • Finalist, Construct AI, EMUSoft
